

# Peeling and coring machine

**Model PL2AV/PL4AV**

Grapefruit, kiwi

The semi-automatic peeling machine for citrus and kiwi with manual loading can have 2 or 4 peeling stations. The operator manually loads the fruit into the appropriate holder and operates the machine. The trolley where the fruit-holders are positioned starts and transfers the fruits to the core tube or to the tools used for the kiwi. Here the fruit turns and is peeled met a rotating knife. The arm of the cutting head follows a fixed shape. Once the peeling is completed, as an option two blades can cut the top & tail. Finally, the machine ejects the fruit onto the product conveyor belt or onto rollers agreed upon by the customer.
